## 3.1 SYMBOL TABLES

---

► API

► *elementary implementations*

► *ordered operations*

# Symbol tables

---

Key-value pair abstraction.

- **Insert** a value with specified key.
- Given a key, **search** for the corresponding value.

Ex. DNS lookup.

- Insert domain name with specified IP address.
- Given domain name, find corresponding IP address.

domain name	IP address
www.cs.princeton.edu	128.112.136.11
www.princeton.edu	128.112.128.15
www.yale.edu	130.132.143.21
www.harvard.edu	128.103.060.55
www.simpsons.com	209.052.165.60

key

value

# Symbol table applications

---

application	purpose of search	key	value
dictionary	find definition	word	definition
book index	find relevant pages	term	list of page numbers
file share	find song to download	name of song	computer ID
financial account	process transactions	account number	transaction details
web search	find relevant web pages	keyword	list of page names
compiler	find properties of variables	variable name	type and value
routing table	route Internet packets	destination	best route
DNS	find IP address	domain name	IP address
reverse DNS	find domain name	IP address	domain name
genomics	find markers	DNA string	known positions
file system	find file on disk	filename	location on disk

# Basic symbol table API

Associative array abstraction. Associate one value with each key.

public class ST<Key, Value>	
ST()	<i>create a symbol table</i>
void put(Key key, Value val)	<i>put key-value pair into the table (remove key from table if value is null)</i>
Value get(Key key)	<i>value paired with key (null if key is absent)</i>
void delete(Key key)	<i>remove key (and its value) from table</i>
boolean contains(Key key)	<i>is there a value paired with key?</i>
boolean isEmpty()	<i>is the table empty?</i>
int size()	<i>number of key-value pairs in the table</i>
Iterable<Key> keys()	<i>all the keys in the table</i>

# Conventions

---

- Values are not null.
- Method get() returns null if key not present.
- Method put() overwrites old value with new value.

## Intended consequences.

- Easy to implement contains().

```
public boolean contains(Key key)
{   return get(key) != null; }
```

- Can implement lazy version of delete().

```
public void delete(Key key)
{   put(key, null); }
```

# Keys and values

---

Value type. Any generic type.

Key type: several natural assumptions.

- Assume keys are Comparable, use compareTo().
- Assume keys are any generic type, use equals() to test equality.
- Assume keys are any generic type, use equals() to test equality; use hashCode() to scramble key.

specify Comparable in API.

built-in to Java  
(stay tuned)

Best practices. Use immutable types for symbol table keys.

- Immutable in Java: Integer, Double, String, java.io.File, ...
- Mutable in Java: StringBuilder, java.net.URL, arrays, ...

# Equality test

---

All Java classes inherit a method `equals()`.

**Java requirements.** For any references  $x$ ,  $y$  and  $z$ :

- Reflexive:  $x.equals(x)$  is true.
  - Symmetric:  $x.equals(y)$  iff  $y.equals(x)$ .
  - Transitive: if  $x.equals(y)$  and  $y.equals(z)$ , then  $x.equals(z)$ .
  - Non-null:  $x.equals(null)$  is false.
-  equivalence relation

**Default implementation.**  $(x == y)$

do  $x$  and  $y$  refer to  
the same object?

**Customized implementations.** `Integer`, `Double`, `String`, `java.io.File`, ...

**User-defined implementations.** Some care needed.

# Implementing equals for user-defined types

---

Seems easy.

```
public class Date implements Comparable<Date>
{
    private final int month;
    private final int day;
    private final int year;
    ...

    public boolean equals(Date that)
    {

        if (this.day != that.day) return false;
        if (this.month != that.month) return false;
        if (this.year != that.year) return false;
        return true;
    }
}
```

check that all significant  
fields are the same

# Implementing equals for user-defined types

Seems easy, but requires some care.

typically unsafe to use equals() with inheritance  
(would violate symmetry)

```
public final class Date implements Comparable<Date>
{
    private final int month;
    private final int day;
    private final int year;
    ...
    public boolean equals(Object y)
    {
        if (y == this) return true;           ← optimize for true object equality
        if (y == null) return false;          ← check for null
        if (y.getClass() != this.getClass()) ← objects must be in the same class
            return false;                  (religion: getClass() vs. instanceof)
        Date that = (Date) y;
        if (this.day != that.day) return false; ← cast is guaranteed to succeed
        if (this.month != that.month) return false; ← check that all significant
        if (this.year != that.year) return false;   fields are the same
        return true;
    }
}
```

must be Object.  
Why? Experts still debate.

# Equals design

---

"Standard" recipe for user-defined types.

- Optimization for reference equality.
- Check against null.
- Check that two objects are of the same type and cast.
- Compare each significant field:
  - if field is a primitive type, use `==`
  - if field is an object, use `equals()` ← apply rule recursively
  - if field is an array, apply to each entry ← alternatively, use `Arrays.equals(a, b)` or `Arrays.deepEquals(a, b)`, but not `a.equals(b)`

Best practices.

- No need to use calculated fields that depend on other fields.
- Compare fields mostly likely to differ first.
- Make `compareTo()` consistent with `equals()`.

 `x.equals(y)` if and only if `(x.compareTo(y) == 0)`

## ST test client for traces

---

Build ST by associating value  $i$  with  $i^{th}$  string from standard input.

```
public static void main(String[] args)
{
    ST<String, Integer> st = new ST<String, Integer>();
    for (int i = 0; !StdIn.isEmpty(); i++)
    {
        String key = StdIn.readString();
        st.put(key, i);
    }
    for (String s : st.keys())
        StdOut.println(s + " " + st.get(s));
}
```

**output**

A	8
C	4
E	12
H	5
L	11
M	9
P	10
R	3
S	0
X	7

<b>keys</b>	S	E	A	R	C	H	E	X	A	M	P	L	E
<b>values</b>	0	1	2	3	4	5	6	7	8	9	10	11	12

## ST test client for analysis

---

**Frequency counter.** Read a sequence of strings from standard input and print out one that occurs with highest frequency.

```
% more tinyTale.txt  
it was the best of times  
it was the worst of times  
it was the age of wisdom  
it was the age of foolishness  
it was the epoch of belief  
it was the epoch of incredulity  
it was the season of light  
it was the season of darkness  
it was the spring of hope  
it was the winter of despair
```

```
% java FrequencyCounter 1 < tinyTale.txt  
it 10
```

```
% java FrequencyCounter 8 < tale.txt  
business 122
```

```
% java FrequencyCounter 10 < leipzig1M.txt  
government 24763
```

tiny example  
(60 words, 20 distinct)

real example  
(135,635 words, 10,769 distinct)

real example  
(21,191,455 words, 534,580 distinct)

# Frequency counter implementation

```
public class FrequencyCounter
{
    public static void main(String[] args)
    {
        int minlen = Integer.parseInt(args[0]);
        ST<String, Integer> st = new ST<String, Integer>(); ← create ST
        while (!StdIn.isEmpty())
        {
            String word = StdIn.readString(); ← read string and update frequency
            if (word.length() < minlen) continue; ← ignore short strings
            if (!st.contains(word)) st.put(word, 1);
            else st.put(word, st.get(word) + 1);
        }
        String max = "";
        st.put(max, 0);
        for (String word : st.keys())
            if (st.get(word) > st.get(max))
                max = word; ← print a string with max freq
        StdOut.println(max + " " + st.get(max));
    }
}
```

create ST

read string and update frequency

print a string with max freq

# Sequential search in a linked list

**Data structure.** Maintain an (unordered) linked list of key-value pairs.

**Search.** Scan through all keys until find a match.

**Insert.** Scan through all keys until find a match; if no match add to front.

Trace of linked-list ST implementation for standard indexing client

# Elementary ST implementations: summary

---

ST implementation	worst-case cost (after N inserts)		average case (after N random inserts)		ordered iteration?	key interface
	search	insert	search hit	insert		
sequential search (unordered list)	N	N	N / 2	N	no	equals()

**Challenge.** Efficient implementations of both search and insert.

# Binary search in an ordered array

Data structure. Maintain an ordered array of key-value pairs.

Rank helper function. How many keys  $< k$ ?

keys[]										
successful search for P	0	1	2	3	4	5	6	7	8	9
lo hi m	0 9 4	A C E H L M P R S X								
	5 9 7	A C E H L M P R S X								
	5 6 5	A C E H L M P R S X								
	6 6 6	A C E H L M P R S X								
entries in black are $a[lo..hi]$										
entry in red is $a[m]$										
loop exits with $keys[m] = P$ : return 6										
unsuccessful search for Q	0 9 4	A C E H L M P R S X								
	5 9 7	A C E H L M P R S X								
	5 6 5	A C E H L M P R S X								
	7 6 6	A C E H L M P R S X								
loop exits with $lo > hi$ : return 7										

Trace of binary search for rank in an ordered array

## Binary search: Java implementation

---

```
public Value get(Key key)
{
    if (isEmpty()) return null;
    int i = rank(key);
    if (i < N && keys[i].compareTo(key) == 0) return vals[i];
    else return null;
}
```

```
private int rank(Key key)                                number of keys < key
{
    int lo = 0, hi = N-1;
    while (lo <= hi)
    {
        int mid = lo + (hi - lo) / 2;
        int cmp = key.compareTo(keys[mid]);
        if (cmp < 0) hi = mid - 1;
        else if (cmp > 0) lo = mid + 1;
        else if (cmp == 0) return mid;
    }
    return lo;
}
```

# Binary search: trace of standard indexing client

---

**Problem.** To insert, need to shift all greater keys over.

	keys[]										N	vals[]
